## TOPICS AND GOALS OF THE CONFERENCE

Forming of the level of technical risk, especially identification of hazards associated with degradation as well as wear and tear processes occurring during operations, should be done already at the stage of design. The factor, which essentially affects such behavior, is the possibility of process evolution forecasting. Very important is to have procedures of detection of the periods of initiation as well as the early, low-energy phases of development of such defects.

The purpose of the conference is presentation of the latest achievements in the field of modeling and simulation of mechanical systems' defects, diagnosis of failures resulting from wear and tear as well as low-energy defects, safety of technical systems as well as diagnosis of technical condition and development of defects in structures, and also the issues from the field of tribology and operations in the broad sense of the term.
